User Documentation

The aim of this programming project is to manage a social network. This social network is formed by people that may be linked among each other if there is a friendship relationship between them.

If one runs program, menu options are displayed, where one can choose loading data from file with people, file with realtionships between people, displaying loaded data, saving current data to new files, deleting people (including all of their relationships) and deleting particular relationship.

One has to type file name without '.txt' extension if decides to load data from file with people or from file with relationships.

If one decides to display data from people or relationships files, data will be listed on screen.

One has to type file name without '.txt' extension when decides to save current data. If file has already existed, it will be overwritten.

One has to type person's ID if decides to delete person from data. All relationships that include this ID will be removed.

Deleting relationship between two people from data requires typing their IDs.

This program is protected from invalid input:

One cannot input string in menu options. Exception with message "Bad input" will appear on screen, but menu will reload.

Unexisting files cannot be loaded. Error "Such file does not exist" will be displayed, but program will not crash.

Unexisting person cannot be deleted. Exception "Person with that id does not exist" is thrown, but it doesn't interrupt the program.

Program doesn't crash if one tries to delete unexisting relationship.

5.3 Package relationships

Classes

- class Relationship
- class Relationships

Class Documentation

6.1 fileHandling.FileHandling Class Reference

Collaboration diagram for fileHandling. FileHandling:

```
{fileHandling.FileHandling
||+ static List< String
> readFile(String fileName)
+ static void writeToFile
(String output, String
fileName)
}
```

Static Public Member Functions

- static List< String > readFile (String fileName) throws FileNotFoundException
- static void writeToFile (String output, String fileName) throws IOException

6.1.1 Detailed Description

This class responsible for handling operations related to files It has classes which writes and rides text from/to files

6.1.2 Member Function Documentation

6.1.2.1 readFile()

This method read lines from the whole file.

Parameters

fileName	is String parameter with a file name
----------	--------------------------------------

Returns

list of Strings

Here is the caller graph for this function:

6.1.2.2 writeToFile()

This method write String to the file.

Parameters

output	String which will be written to file
fileName	String contains name of file where output will be written

Exceptions

IOException	This throws could occur when an I/O exception of some sort has occurred.
-------------	--

Here is the caller graph for this function:

6.2 Menu Class Reference

The documentation for this class was generated from the following file:

• D:/Projekty/DSA_ehu_JavaProject/src/fileHandling/FileHandling.java

6.2 Menu Class Reference

Collaboration diagram for Menu:

```
{Menu
||+ static void main(String
[] args)
+ static int menu()
}
```

Static Public Member Functions

- static void main (String[] args)
- static int menu ()

6.2.1 Detailed Description

This class is currently the main class of the projects. It creates the menu that allows user to insert People and Relationships and view them.

6.2.2 Member Function Documentation

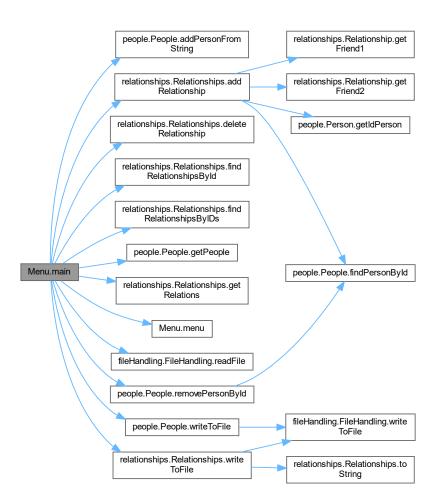

6.2.2.1 main()

This method consist of calls to all functions related to the options presented in menu.

Parameters

args

Here is the call graph for this function:

6.2.2.2 menu()

```
static int Menu.menu ( ) [static]
```

This method prints menu options of our programming project and reads input from the user.

Returns

integer

Here is the caller graph for this function:

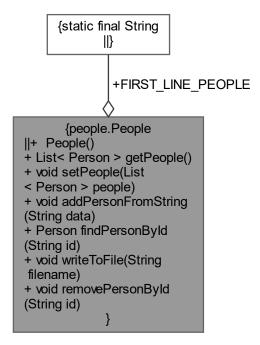

The documentation for this class was generated from the following file:

• D:/Projekty/DSA_ehu_JavaProject/src/Menu.java

6.3 people.People Class Reference

Collaboration diagram for people. People:

Public Member Functions

- People ()
- List< Person > getPeople ()
- void setPeople (List< Person > people)
- void addPersonFromString (String data) throws ParseException
- Person findPersonByld (String id)
- void writeToFile (String filename) throws IOException
- void removePersonById (String id)

Static Public Attributes

• static final String FIRST_LINE_PEOPLE = "idperson,name,lastname,birthdate,gender,birthplace,home,studiedat,workplaces,fill

6.3.1 Constructor & Destructor Documentation

6.3.1.1 People()

```
people.People ( )
```

Constructor for a People class.

6.3.2 Member Function Documentation

6.3.2.1 addPersonFromString()

```
void people.People.addPersonFromString ( String \ data \ ) \ throws \ ParseException
```

This method check if the user ID is already in list of people, if not - add person from string to list of people

Parameters

data	is string containing data for creating a new object of Person class.
------	--

Exceptions

ParseException	Signals that an error has been reached unexpectedly while parsing.

Here is the caller graph for this function:

6.3.2.2 findPersonById()

```
Person people.People.findPersonById ( {\tt String} \ id \ )
```

This method finds Person object with corresponding ID in people list.

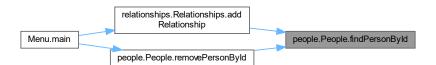

Parameters

Returns

Person object

Here is the caller graph for this function:

6.3.2.3 getPeople()

```
List< Person > people.People.getPeople ( )
```

Getter for a people field.

Returns

list of Person type objects.

Here is the caller graph for this function:

6.3.2.4 removePersonByld()

```
void people.People.removePersonById ( {\tt String} \ id \ )
```

This method removes person with a certain id from the list of people If person with that id does not exist, prints out a message

Parameters

Here is the call graph for this function:

Here is the caller graph for this function:

6.3.2.5 setPeople()

```
void people.People.setPeople ( \label{eq:people} \mbox{List} < \mbox{Person} \ > \mbox{\it people} \ )
```

Setter for a people field.

Parameters

people is list of Person type objects.

6.3.2.6 writeToFile()

This method writes string to given file name.

Parameters

Exceptions

IOException	This throws could occur when writing to a file

Here is the call graph for this function:

Here is the caller graph for this function:

6.3.3 Member Data Documentation

6.3.3.1 FIRST_LINE_PEOPLE

final String people.People.FIRST_LINE_PEOPLE = "idperson, name, lastname, birthdate, gender, birthplace, home, studie
[static]

The documentation for this class was generated from the following file:

• D:/Projekty/DSA_ehu_JavaProject/src/people/People.java

6.4 people.Person Class Reference

Collaboration diagram for people.Person:

```
{people.Person
||+ boolean equals(Object o)
+ int hashCode()
+ Person(String idPerson,
String name, String lastname,
Date birthdate, char gender,
String birthplace, String home,
List < String > studiedAt, List
< String > workplaces, List< String
> films, String groupCode)
+ String getIdPerson()
+ void setIdPerson(String
idPerson)
+ String getName()
+ void setName(String
+ String getLastname()
+ void setLastname(String
lastname)
+ Date getBirthdate()
+ void setBirthdate(Date
birthdate)
+ char getGender()
+ void setGender(char
gender)
+ String getBirthplace()
+ void setBirthplace
(String birthplace)
+ String getHomé()
+ void setHome(String
home)
+ List < String > getStudiedAt()
+ void setStudiedAt(List
< String > studiedAt)
+ List< String > getWorkplaces()
+ void setWorkplaces
(List< String > workplaces)
+ List< String > getFilms()
+ void setFilms(List
< String > films)
+ String getGroupCode()
+ void setGroupCode(String
groupCode)
+ String toString()
```

Public Member Functions

- boolean equals (Object o)
- int hashCode ()

• Person (String idPerson, String name, String lastname, Date birthdate, char gender, String birthplace, String home, List< String > studiedAt, List< String > workplaces, List< String > films, String groupCode)

- String getIdPerson ()
- void setIdPerson (String idPerson)
- String getName ()
- void setName (String name)
- String getLastname ()
- void setLastname (String lastname)
- Date getBirthdate ()
- void setBirthdate (Date birthdate)
- char getGender ()
- void setGender (char gender)
- String getBirthplace ()
- void setBirthplace (String birthplace)
- String getHome ()
- void setHome (String home)
- List< String > getStudiedAt ()
- void setStudiedAt (List< String > studiedAt)
- List< String > getWorkplaces ()
- void setWorkplaces (List< String > workplaces)
- List< String > getFilms ()
- void setFilms (List< String > films)
- String getGroupCode ()
- void setGroupCode (String groupCode)
- String toString ()

6.4.1 Constructor & Destructor Documentation

6.4.1.1 Person()

All-argument constructor for a Person class.

Parameters

idPerson	String contains user ID
name	String contains username
lastname	String contains lastname
birthdate	Date contains birthdate

Parameters

gender	char contains 'M' as 'male' / 'F' as 'female'
birthplace	String contains birthplace
home	String contains name of hometown
studiedAt	list of Strings contains name of university
workplaces	list of Strings contains workplaces
films	list of Strings contains favourites movie titles
groupCode	String contains group code

6.4.2 Member Function Documentation

6.4.2.1 equals()

```
boolean people.Person.equals ( {\tt Object} \ o \ )
```

This method compares this object with object given in parameter. It overrides default method and allows us to use '==' operator.

Parameters

o is an object of undefined type

Returns

boolean

Here is the call graph for this function:

Here is the caller graph for this function:

6.4.2.2 getBirthdate()

```
Date people.Person.getBirthdate ( )
```

Getter for a birthdate field.

Returns

Date type object.

6.4.2.3 getBirthplace()

```
String people.Person.getBirthplace ( )
```

Getter for a birthplace field.

Returns

String type object.

6.4.2.4 getFilms()

```
List< String > people.Person.getFilms ( )
```

Getter for a films field.

Returns

List of String type objects.

6.4.2.5 getGender()

char people.Person.getGender ()

Getter for a gender field.

Returns

char type object.

6.4.2.6 getGroupCode()

String people.Person.getGroupCode ()

Getter for a groupCode field.

Returns

String type object.

6.4.2.7 getHome()

String people.Person.getHome ()

Getter for a getHome field.

Returns

String type object.

6.4.2.8 getIdPerson()

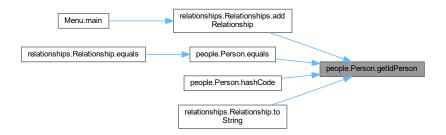

String people.Person.getIdPerson ()

Getter for a idPerson field.

Returns

String type object.

Here is the caller graph for this function:

6.4.2.9 getLastname()

```
String people.Person.getLastname ( )
```

Getter for a lastname field.

Returns

String type object.

6.4.2.10 getName()

```
String people.Person.getName ( )
```

Getter for a name field.

Returns

String type object.

6.4.2.11 getStudiedAt()

```
List< String > people.Person.getStudiedAt ( )
```

Getter for a studiedAt field.

Returns

List of String type objects.

6.4.2.12 getWorkplaces()

```
List< String > people.Person.getWorkplaces ( )
```

Getter for a workplaces field.

Returns

List of String type objects.

6.4.2.13 hashCode()

```
int people.Person.hashCode ( )
```

This method overrides default method and returns the integer hash code value of the object.

Returns

integer

Here is the call graph for this function:

6.4.2.14 setBirthdate()

Setter for a birthdate field.

Parameters

birthdate	is a Date type object.

6.4.2.15 setBirthplace()

Setter for a birthplace field.

Parameters

birthplace	is a String type object.

6.4.2.16 setFilms()

```
void people.Person.setFilms ( \label{eq:list} \mbox{List} < \mbox{String} \ > \mbox{\it films} \ )
```

Setter for a films field.

Parameters

```
films is a list of String type object.
```

6.4.2.17 setGender()

```
void people.Person.setGender ( {\tt char} \ {\it gender} \ )
```

Setter for a gender field.

Parameters

```
gender is a char type object.
```

6.4.2.18 setGroupCode()

Setter for a groupCode field.

Parameters

```
groupCode is a String type object.
```

6.4.2.19 setHome()

```
void people.Person.setHome ( {\tt String}\ {\it home}\ )
```

Setter for a home field.

Parameters

home	is a String type object.
------	--------------------------

6.4.2.20 setIdPerson()

Setter for a idPerson field.

Parameters

idPerson	is a String type object.
----------	--------------------------

6.4.2.21 setLastname()

Setter for a lastname field.

Parameters

lastname is a String type object	ct.
------------------------------------	-----

6.4.2.22 setName()

```
void people.Person.setName ( {\tt String} \ \textit{name} \ )
```

Setter for a name field.

Parameters

name	is a String type object.

6.4.2.23 setStudiedAt()

```
void people.Person.setStudiedAt ( \label{eq:list} \mbox{List} < \mbox{String} \ > \mbox{\it studiedAt} \ )
```

Setter for a studiedAt field.

Parameters

studied←	is a list of String type object.
At	

6.4.2.24 setWorkplaces()

Setter for a workplaces field.

Parameters

workplaces	is a list of String type object.
------------	----------------------------------

6.4.2.25 toString()

```
String people.Person.toString ( )
```

This method overrides default method and returns a string representation of this object.

Returns

string

The documentation for this class was generated from the following file:

• D:/Projekty/DSA_ehu_JavaProject/src/people/Person.java

6.5 relationships.Relationship Class Reference

Collaboration diagram for relationships. Relationship:

```
{relationships.Relationship
||+ String toString()
+ boolean equals(Object o)
+ int hashCode()
+ Relationship(Person
friend1, Person friend2)
+ Person getFriend1()
+ void setFriend1(Person
friend1)
+ Person getFriend2()
+ void setFriend2(Person
friend2)
}
```

Public Member Functions

- String toString ()
- boolean equals (Object o)
- int hashCode ()
- Relationship (Person friend1, Person friend2)
- Person getFriend1 ()
- void setFriend1 (Person friend1)
- Person getFriend2 ()
- void setFriend2 (Person friend2)

6.5.1 Detailed Description

This class represents a single relationship between two people. Consists of two objects of type Person. @field friend1 an absolute URL giving the base location of the image @field friend2 the location of the image, relative to the url argument

6.5.2 Constructor & Destructor Documentation

6.5.2.1 Relationship()

Constructor for a Relationships class.

Parameters

friend1	is parameter of Person type.
friend2	is parameter of Person type.

6.5.3 Member Function Documentation

6.5.3.1 equals()

```
boolean relationships.Relationship.equals ( {\tt Object\ o\ )}
```

This method compares this object with object given in parameter. It overrides default method and allows us to use '==' operator.

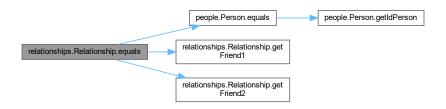

Parameters

o is an object of undefined type

Returns

boolean

Here is the call graph for this function:

6.5.3.2 getFriend1()

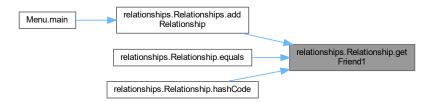

```
Person relationships.Relationship.getFriend1 ( )
```

Getter for a friend1 field.

Returns

object of Person type.

Here is the caller graph for this function:

6.5.3.3 getFriend2()

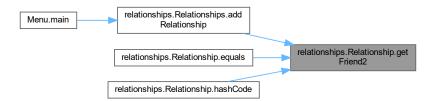

Person relationships.Relationship.getFriend2 ()

Getter for a friend2 field.

Returns

object of Person type.

Here is the caller graph for this function:

6.5.3.4 hashCode()

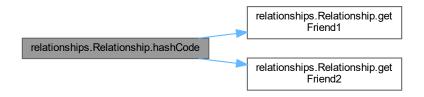

```
int relationships.Relationship.hashCode ( )
```

This method overrides default method and returns the integer hash code value of the object.

Returns

integer

Here is the call graph for this function:

6.5.3.5 setFriend1()

```
void relationships.Relationship.setFriend1 ( {\tt Person} \ friend1 \ )
```

Setter for a friend1 field.

Parameters

friend1	is parameter of Person type.

6.5.3.6 setFriend2()

Setter for a friend2 field.

Parameters

frianda	is parameter of Person type.
menu≥	is parameter of reison type.

6.5.3.7 toString()

```
String relationships.Relationship.toString ( )
```

This method returns a string representation of this object.

Returns

string

Here is the call graph for this function:

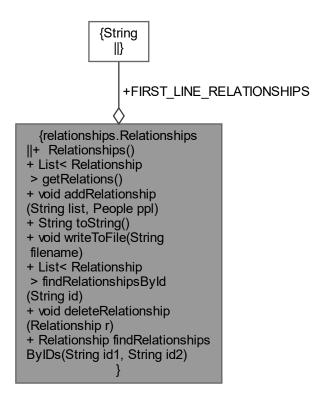

The documentation for this class was generated from the following file:

 $\bullet \ \, \text{D:/Projekty/DSA_ehu_JavaProject/src/relationships/Relationship.java}$

6.6 relationships.Relationships Class Reference

Collaboration diagram for relationships. Relationships:

Public Member Functions

- Relationships ()
- List< Relationship > getRelations ()
- void addRelationship (String list, People ppl)
- String toString ()
- void writeToFile (String filename) throws IOException
- List< Relationship > findRelationshipsByld (String id)
- void deleteRelationship (Relationship r)
- Relationship findRelationshipsByIDs (String id1, String id2)

Static Public Attributes

• static final String FIRST_LINE_RELATIONSHIPS = "friend1,friend2\n"

6.6.1 Constructor & Destructor Documentation

6.6.1.1 Relationships()

```
relationships.Relationships ( )
```

Constructor for a Relationships class.

6.6.2 Member Function Documentation

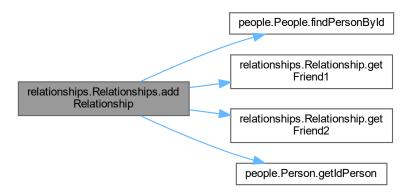

6.6.2.1 addRelationship()

This method check if relationship for two people exists. If not - create relationship between two people and add this relationship to list of relationships.

Parameters

lis	t	This parameter is string list which consists two user IDs.
pp	ol	This parameter is People type object which have list of all users

Here is the call graph for this function:

Here is the caller graph for this function:

6.6.2.2 deleteRelationship()

Removes passed relationship from the list of relationships

Parameters

r Relation

Here is the caller graph for this function:

6.6.2.3 findRelationshipsByld()

```
List< Relationship > relationships. Relationships. find Relationships By Id ( String id )
```

This method finds every relationship containing passed id

Parameters

Returns

List<Relationship> List of relationships containing that id

Here is the caller graph for this function:

6.6.2.4 findRelationshipsByIDs()

```
Relationship relationships.Relationships.findRelationshipsByIDs ( {\tt String}\ id1, \\ {\tt String}\ id2\ )
```

This method finds relationship containing passed IDs

Parameters

id1	String
id2	String

Returns

Relationship containing passed IDs

Here is the caller graph for this function:

6.6.2.5 getRelations()

```
List < Relationship > relationships.Relationships.getRelations ( )
```

Getter for a relations field.

Returns

list of Relationship objects

Here is the caller graph for this function:

6.6.2.6 toString()

```
String relationships.Relationships.toString ( )
```

This method overrides default method and returns a string representation of this object.

Returns

string

Here is the caller graph for this function:

6.6.2.7 writeToFile()

```
void relationships.Relationships.writeToFile ( {\tt String} \ filename \ ) \ {\tt throws} \ {\tt IOException}
```

This method writes string to given file name.

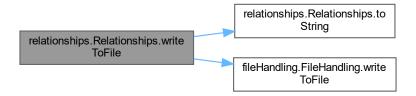

Parameters

filename	string
----------	--------

Exceptions

IOException	This throws could occur when writing to a file
-------------	--

Here is the call graph for this function:

Here is the caller graph for this function:
